

**6-SUBSTITUTED 2,3,4,5-TETRAHYDRO-1H-BENZO[d]AZEPINES
AS 5-HT_{2C} RECEPTOR AGONISTS**

The neurotransmitter serotonin (5-hydroxytryptamine, 5-HT) has a rich
5 pharmacology arising from a heterogeneous population of at least seven receptor classes.
The serotonin 5-HT₂ class is further subdivided into at least three subtypes, designated 5-
HT_{2A}, 5-HT_{2B}, and 5-HT_{2C}. The 5-HT_{2C} receptor has been isolated and characterized
(Julius, *et al.*, U.S. Patent No. 4,985,352), and transgenic mice lacking the 5-HT_{2C}
receptor have been reported to exhibit seizures and an eating disorder resulting in
10 increased consumption of food (Julius *et al.*, U.S. Patent No. 5,698,766). The 5-HT_{2C}
receptor has also been linked to various other neurological disorders including obesity
(Vickers *et al.*, Psychopharmacology, 167: 274-280 (2003)), hyperphagia (Tecott *et al.*,
Nature, 374: 542-546 (1995)), obsessive compulsive disorder (Martin *et al.*, Pharmacol.
Biochem. Behav., 71: 615 (2002); Chou-Green *et al.*, Physiology & Behavior, 78: 641-
15 649 (2003)), depression (Leysen, Kelder, Trends in Drug Research II, 29: 49-61 (1998)),
anxiety (Curr. Opin. Invest. Drugs 2(4), p. 317 (1993)), substance abuse, sleep disorder
(Frank *et al.*, Neuropsychopharmacology 27: 869-873 (2002)), hot flashes (EP 1213017
A2), epilepsy (Upton *et al.*, Eur. J. Pharmacol., 359: 33 (1998); Fitzgerald, Ennis, Annual
Reports in Medicinal Chemistry, 37: 21-30 (2002)), and hypogonadism (Curr. Opin.
20 Invest. Drugs 2(4), p. 317 (1993)).

Certain substituted 2,3,4,5-tetrahydro-1H-benzo[d]azepine compounds have been
disclosed as useful therapeutics as for example:

US 4,265,890 describes certain substituted 2,3,4,5-tetrahydro-1H-benzo[d]azepine
25 compounds as dopaminergic receptor antagonists for use as antipsychotics and
antiemetics, *inter alia*.

EP 0 285 287 describes certain substituted 2,3,4,5-tetrahydro-1H-benzo[d]azepine
compounds for use as agents to treat gastrointestinal motility disorders, *inter alia*.

35

WO 93/03015 and WO 93/04686 describe certain substituted 2,3,4,5-tetrahydro-1H-benzo[d]azepine compounds as alpha-adrenergic receptor antagonists for use as agents to treat hypertension and cardiovascular diseases in which changes in vascular resistance are desirable, *inter alia*.

5

WO 02/074746 A1 describes certain substituted 2,3,4,5-tetrahydro-1H-benzo[d]azepine compounds as 5-HT_{2C} agonists for the treatment of hypogonadism, obesity, hyperphagia, anxiety, depression, sleep disorder, *inter alia*.

10

WO 03/006466 A1 describes certain substituted tricyclic hexahydroazepinoindole and indoline compounds as 5-HT ligands and consequently their usefulness for treating diseases wherein modulation of 5-HT activity is desired.

15

High affinity 5-HT_{2C} receptor agonists would provide useful therapeutics for the treatment of the above mentioned 5-HT_{2C} receptor-associated disorders including obesity, hyperphagia, obsessive/compulsive disorder, depression, anxiety, substance abuse, sleep disorder, hot flashes, and hypogonadism. High affinity 5-HT_{2C} receptor agonists that are also selective for the 5-HT_{2C} receptor, would provide such therapeutic benefit without the undesirable adverse events associated with current therapies. Achieving selectivity for the 5-HT_{2C} receptor, particularly as against the 5-HT_{2A} and 5-HT_{2B} receptors, has proven difficult in designing 5-HT_{2C} agonists. 5-HT_{2A} receptor agonists have been associated with problematic hallucinogenic adverse events. (Nelson *et al.*, Naunyn-Schmiedeberg's Arch. Pharm., 359: 1-6 (1999)). 5-HT_{2B} receptor agonists have been associated with cardiovascular related adverse events, such as valvulopathy. (V. Setola *et al.*, Mol. Pharmacology, 63: 1223-1229 (2003), and ref. cited therein).

30

Previous references to substituted 2,3,4,5-tetrahydro-1H-benzo[d]azepine compounds as potential therapeutics have predominately recited their uses as alpha adrenergic and/or dopaminergic modulators. Adrenergic modulators are often associated with the treatment of cardiovascular diseases (Frishman, Kotob, Journal of Clinical Pharmacology, 39: 7-16 (1999)). Dopaminergic receptors are primary targets in the treatment of schizophrenia and Parkinson's disease (Seeman, Van Tol, Trends in

Pharmacological Sciences, 15: 264-270 (1994)). It will be appreciated by those skilled in the art that selectivity as against these and other physiologically important receptors will generally also be preferred characteristics for therapeutics for the specific treatment of 5-HT_{2C} associated disorders as described above.

In those instances where the disorders which can be treated by 5-HT_{2C} agonists are
30 known by established and accepted classifications, their classifications can be found in various sources. For example, at present, the fourth edition of the Diagnostic and Statistical Manual of Mental Disorders (DSM-IV™) (1994, American Psychiatric

Association, Washington, D.C.), provides a diagnostic tool for identifying many of the disorders described herein. Also, the International Classification of Diseases, Tenth Revision (ICD-10), provides classifications for many of the disorders described herein. The skilled artisan will recognize that there are alternative nomenclatures, nosologies, and classification systems for disorders described herein, including those as described in the DSM-IV and ICD-10, and that terminology and classification systems evolve with medical scientific progress.

It is to be understood that when a basic definition of a group lists optionally allowable substituents, and in another place that group is said to also optionally be substituted with other recited substituents, then those other recited substituents are intended to be added to the list of optionally allowable substituents listed in the basic definition of the group. Conversely, if in another place that group is said to be alternatively, optionally substituted with other recited substituents, then those other recited substituents are intended to replace the list of optionally allowable substituents

recited in the basic definition of the substituent. For example, but without limitation, Ar^2 has a basic definition that recites that any of the listed heteroaromatic groups may “optionally be substituted with 1 to 3 substituents independently selected from the group consisting of halo, cyano, $-\text{SCF}_3$, $(\text{C}_1\text{-C}_6)$ alkyl optionally further substituted with 1 to 6 fluoro substituents, and $(\text{C}_1\text{-C}_6)$ alkoxy optionally further substituted with 1 to 6 fluoro substituents, and wherein pyridyl and pyridazinyl may also optionally be substituted with $(\text{C}_1\text{-C}_6)$ alkylamino optionally further substituted with 1 to 6 fluoro substituents, $(\text{C}_3\text{-C}_7)$ cycloalkyl $(\text{C}_0\text{-C}_3)$ alkyl, or $(\text{C}_3\text{-C}_7)$ cycloalkyl $(\text{C}_0\text{-C}_3)$ alkyl-amino.” This is to be understood to mean that any of the listed heteroaromatic groups may optionally be substituted with [1 to 3 substituents independently selected from the group consisting of halo, cyano, $-\text{SCF}_3$, $(\text{C}_1\text{-C}_6)$ alkyl optionally further substituted with 1 to 6 fluoro substituents, and $(\text{C}_1\text{-C}_6)$ alkoxy optionally further substituted with 1 to 6 fluoro substituents], and that when Ar^2 is selected to be pyridyl or pyridazinyl, the list of substituents selectable for the 1 to 3 substituents is expanded to also include $[(\text{C}_1\text{-C}_6)$ alkylamino optionally further substituted with 1 to 6 fluoro substituents, $(\text{C}_3\text{-C}_7)$ cycloalkyl $(\text{C}_0\text{-C}_3)$ alkyl, and $(\text{C}_3\text{-C}_7)$ cycloalkyl $(\text{C}_0\text{-C}_3)$ alkyl-amino]. Likewise, in the definition of R^{14} , the terminology “wherein . . . Ar^2 , wherein Ar^2 is pyridyl, then R^{14} may also, optionally be substituted with phenyl- $\text{CH}=\text{CH}$ - or phenyl- $\text{C}\equiv\text{C}$ - . . .” is understood to mean that the list of substituents selectable for the 1 to 3 substituents optionally allowed on $\text{Ar}^2 = \text{pyridyl}$ is again expanded to also include [phenyl- $\text{CH}=\text{CH}$ - or phenyl- $\text{C}\equiv\text{C}$ - . . .]. Conversely, later in the definition of R^{14} , the terminology “wherein when Ar^2 is pyridyl, the pyridyl may alternatively, optionally be substituted with $\text{R}^{28}\text{R}^{29}\text{N-C(O)-}$ and optionally further substituted with one methyl, $-\text{CF}_3$, cyano, or $-\text{SCF}_3$ substituent, or with 1 to 2 halo substituents”, is understood to mean that when R^{14} is selected to be $\text{Ar}^2 = \text{pyridyl}$, then the list of 1 to 3 independently selected substituents optionally allowable in the basic definition of Ar^2 may be superseded by “ $\text{R}^{28}\text{R}^{29}\text{N-C(O)-}$ and optionally further substituted with one methyl, $-\text{CF}_3$, cyano, or $-\text{SCF}_3$ substituent, or with 1 to 2 halo substituents.”

The term “amino protecting group” as used in this specification refers to a substituent commonly employed to block or protect the amino functionality while reacting other functional groups on the compound. Examples of such amino protecting groups

include the formyl group, the trityl group, the acetyl group, the trichloroacetyl group, the trifluoroacetyl group, the chloroacetyl, bromoacetyl, and iodoacetyl groups, carbamoyl-type blocking groups such as benzyloxycarbonyl, 9-fluorenylmethoxycarbonyl ("Fmoc"), *t*-butoxycarbonyl (*t*-BOC), and like amino protecting groups. The species of amino protecting group employed is not critical so long as the derivatized amino group is stable to the conditions of subsequent reactions on other positions of the molecule and can be removed at the appropriate point without disrupting the remainder of the molecule. The selection and use (addition and subsequent removal) of amino protecting groups is well known within the ordinary skill of the art. Further examples of groups referred to by the above terms are described by T. W. Greene and P. G. M. Wuts, "Protective Groups in Organic Synthesis", 3rd edition, John Wiley and Sons, New York, NY, 1999, chapter 7, hereafter referred to as "*Greene*".

The term "pharmaceutical" or "pharmaceutically acceptable" when used herein as an adjective, means substantially non-toxic and substantially non-deleterious to the recipient.

By "pharmaceutical composition" it is further meant that the carrier, solvent, excipients and/or salt must be compatible with the active ingredient of the composition (e.g. a compound of Formula I). It is understood by those of ordinary skill in this art that the terms "pharmaceutical formulation" and "pharmaceutical composition" are generally interchangeable, and they are so used for the purposes of this application.

The term "effective amount" means an amount of a compound of Formula I which is capable of activating 5-HT_{2C} receptors and/or elicit a given pharmacological effect.

The term "suitable solvent" refers to any solvent, or mixture of solvents, inert to the ongoing reaction that sufficiently solubilizes the reactants to afford a medium within which to effect the desired reaction.

It is understood that compounds of the present invention may exist as stereoisomers. As such, all enantiomers, diastereomers, and mixtures thereof, are included within the scope of the present invention. Where specific stereochemistries are

identified in this application, the Cahn-Prelog-Ingold designations of (R)- and (S)- and the cis and trans designation of relative stereochemistry are used to refer to specific isomers and relative stereochemistry. Known optical rotations are designated by (+) and (-) for dextrorotatory and levorotatory, respectively. Where a chiral compound is resolved into
5 its isomers, but absolute configurations or optical rotations are not determined, the isomers are arbitrarily designated as isomer 1, isomer 2, etc. While all enantiomers, diastereomers, and mixtures thereof, are contemplated within the present invention, preferred embodiments are single enantiomers and single diastereomers.

10 It is generally understood by those skilled in this art, that compounds intended for use in pharmaceutical compositions are routinely, though not necessarily, converted to a salt form in efforts to optimize such characteristics as the handling properties, stability, pharmacokinetic, and/or bioavailability, etc. Methods for converting a compound to a given salt form are well known in the art (see for example, Berge, S.M, Bighley, L.D., and
15 Monkhouse, D.C., *J. Pharm. Sci.*, 66:1, (1977)). In that the compounds of the present invention are amines and therefore basic in nature, they readily react with a wide variety of pharmaceutically acceptable organic and inorganic acids to form pharmaceutically acceptable acid addition salts therewith. Such salts are also embodiments of this invention.

20 Typical inorganic acids used to form such salts include hydrochloric, hydrobromic, hydroiodic, nitric, sulfuric, phosphoric, hypophosphoric, metaphosphoric, pyrophosphoric acid, and the like. Salts derived from organic acids, such as aliphatic mono and dicarboxylic acids, phenyl substituted alkanoic acids, hydroxyalkanoic and
25 hydroxyalkandioic acids, aromatic acids, aliphatic and aromatic sulfonic acids, may also be used. Such pharmaceutically acceptable salts thus include chloride, bromide, iodide, nitrate, acetate, phenylacetate, trifluoroacetate, acrylate, ascorbate, benzoate, chlorobenzoate, dinitrobenzoate, hydroxybenzoate, methoxybenzoate, methylbenzoate, o-acetoxybenzoate, isobutyrate, phenylbutyrate, α -hydroxybutyrate, butyne-1,4-
30 dicarboxylate, hexyne-1,4-dicarboxylate, caprate, caprylate, cinnamate, citrate, formate, fumarate, glycolate, heptanoate, hippurate, lactate, malate, maleate, hydroxymaleate, malonate, mandelate, nicotinate, isonicotinate, oxalate, phthalate, terephthalate,

propiolate, propionate, phenylpropionate, salicylate, sebacate, succinate, suberate,
benzenesulfonate, p-bromobenzenesulfonate, chlorobenzenesulfonate, ethylsulfonate,
2-hydroxyethylsulfonate, methylsulfonate (mesylate), naphthalene-1-sulfonate,
naphthalene-2-sulfonate, naphthalene-1,5-sulfonate, p-toluenesulfonate, xylenesulfonate,
5 tartrate, and the like.

It is well known that such compounds can form salts in various molar ratios with
the acid to provide, for example, the hemi-acid, mono-acid, di-acid salt, etc. Where in the
salt formation procedure, the acid is added in a specific stoichiometric ratio, unless
10 otherwise analyzed to confirm, the salt is presumed, but not known, to form in that molar
ratio. Terms such as “(acid)_x” are understood to mean that the molar ratio of the salt
formed is not known and can not be presumed, as for example, but without limitation,
(HCl)_x and (methanesulfonic acid)_x.

25 It will be appreciated that the preferred definitions of the various substituents recited herein may be taken alone or in combination and, unless otherwise stated, apply to

the generic formula (I) for compounds of the present invention, as well as to the preferred class of compounds represented by formula (Ia).

The compounds of the invention can be prepared according to the following synthetic schemes by methods well known and appreciated in the art. Suitable reaction conditions for the steps of these schemes are well known in the art and appropriate substitutions of solvents and co-reagents are within the skill of the art. Likewise, it will be appreciated by those skilled in the art that synthetic intermediates may be isolated and/or purified by various well known techniques as needed or desired, and that frequently, it will be possible to use various intermediates directly in subsequent synthetic steps with little or no purification. Furthermore, the skilled artisan will appreciate that in some circumstances, the order in which moieties are introduced is not critical. The particular order of steps required to produce the compounds of Formula I is dependent upon the particular compound being synthesized, the starting compound, and the relative liability of the substituted moieties as is well appreciated by those of ordinary skill in the art. All substituents, unless otherwise indicated, are as previously defined, and all reagents are well known and appreciated in the art.

Compounds of Formula I where R^6 is an acetylene-linked substituent may be prepared as illustrated in Scheme I where Pg is a suitable protecting group for a secondary amine such as, but not limited to, 2,2,2-trifluoroacetyl or *tert*-butoxycarbonyl, and variables R^1 , R^2 , R^4 , R^5 , R^7 , R^8 , R^9 and R^{10} are as previously defined.

Scheme I

Mix the 6-triflate of the 2,3,4,5-tetrahydro-1H-benzo[d]azepines (a) with an appropriately substituted acetylene, a suitable palladium/copper catalyst mixture in a

solvent, typically DMF, using triethylamine as base, and heat to afford the desired compound (b). Deprotection reaction and the standard extractive and chromatographic techniques afford the desired compound (1a).

5 The appropriate 6-triflate of 2,3,4,5-tetrahydro-1*H*-benzo[*d*]azepines (a) may be prepared as described in Scheme II. Compound (a) may be prepared from 1-Naphthol. 1-Naphthol can be converted to 5-hydroxy-1,4-dihydronaphthalene (c) by Birch reduction using ammonia and lithium metal at low temperature. Methylation of the 6-hydroxy
10 group affords the compound (d). Ozonolysis of (d) and subsequent reduction with sodium borohydride provide the diol (e). After converting the two hydroxyl groups into two good leaving groups, for example methanesulfonates, cyclize the compound (f) to the 6-methoxy-2,3,4,5-tetrahydro-1*H*-benzo[*d*]azepines (g) with aqueous ammonia under pressure. Protect the ring nitrogen with a variety of alkyl halides, acid chlorides or anhydrides such as trifluoroacetic anhydride to give compound (h). Subsequently convert
15 the methyl ether (h) to the phenol (i) with BBr₃ in dichloromethane or other methods well known in the literature [see for example, Greene and Wuts, Protective Groups in Organic Synthesis, 3rd Ed., John Wiley and sons, Chapter III, New York (1999)].

20 Functionalization of the aromatic ring to introduce substituents R⁷, R⁸ and R⁹ are well known in the art and very depending on the substitution desired. Subsequent trifluoromethanesulfonylation of the 6-hydroxy (j) affords the desired 2,3,4,5-tetrahydro-1*H*-benzo[*d*]azepines (a).

Scheme II

Alternately, compound (g) could be prepared from 1,2-bis(cyanomethyl)-3-methoxybenzene (l), previously described in the literature (*J. Med. Chem.* 1984, 27, 918-921), as shown in Scheme III below.

Scheme III

Compounds of Formula I where R^6 is an oxygen-linked substituent may be prepared as illustrated in Scheme IV where Pg is a suitable protecting group for secondary amine, such as 2,2,2-trifluoroacetyl or tert-butoxycarbonyl, and variables R^7 , R^9 and R^{12} are as previously defined.

Scheme IV

Compound (m) can be prepared by treating 6-hydroxy-2,3,4,5-tetrahydro-1H-benzo[d]azepines (j) with an appropriate alkylation reagent, such as an alkyl halide or sulfonate, and a base in a suitable solvent, typically acetone, ethanol or acetonitrile, followed by the standard extractive and chromatographic techniques. Deprotection of the ring nitrogen gives the compound (Ib). Alternately, compound (m) can be obtained by Mitsunobu reaction with an appropriate alcohol, a phosphine reagent such as triphenylphosphine, and diethyl azodicarboxylate (DEAD) or 1,1'-(azodicarbonyl)-dipiperidine in an anhydrous solvent, for example THF.

Compounds of Formula Ic where R⁶ is a nitrogen-linked substituent may be prepared as illustrated in the Scheme V. The 6-triflate protected 2,3,4,5-tetrahydro-1H-benzo[d]azepines (a) can be converted to the compounds (n), under Buchwald conditions, by treatment with an appropriate amine (q) in the presence of an effective palladium catalyst, and a base in a suitable solvent, typically toluene or 1,4-dioxane under an inert atmosphere. Introduction of a second substituent R²⁵, if needed, may be performed. Standard work-up and chromatographic techniques followed by deprotection, give the compound (Ic).

Alternately 6-amino-2,3,4,5-tetrahydro-1H-benzo[d]azepines (p) can be transformed to the desired compounds (n) by reaction with an appropriate bromide (r), and an appropriate base in a suitable solvent.

Bromides (r) are either commercially available or may be prepared by methods well known to the skilled artisan. Amines (q) are either commercially available or may be prepared by methods well known to the skilled artisan.

Scheme V

Compounds of Formula I where the R^6 is a sulfur-linked substituent may be prepared as illustrated in the Scheme VI.

Scheme VI

Heat the appropriately substituted 3-(tert-butoxycarbonyl-6-dimethylcarbamoylthio-2,3,4,5-tetrahydro-1H-benzo[d]azepine (s) with an appropriate base in a suitable solvent, such as methanol, to obtain the intermediate thiol (t). Isolate the intermediate thiol (t), if required, and treat it with an appropriate electrophile (halide or alkyl sulfonate). Isolate the compound (u) by standard extractive and chromatographic techniques and deprotect to afford the desired compound (Id).

The requisite halides or alkyl sulfonates are either commercially available or may be prepared by methods well known to the skilled artisan.

The skilled artisan will also appreciate that not all of the substituents in the compounds of Formula I will tolerate certain reaction conditions employed to synthesize the compounds. These moieties may be introduced at a convenient point in the synthesis, or may be protected and then deprotected as necessary or desired, as is well known in the art. The skilled artisan will appreciate that the protecting groups may be removed at any convenient point in the synthesis of the compounds of the present invention. Methods for introducing and removing protecting groups used in this invention are well known in the art; see, for example, Greene and Wuts, *Protective Groups in Organic Synthesis*, 3rd Ed., John Wiley and sons, New York (1999).

The following Preparations and Examples are illustrative of methods useful for the synthesis of the compounds of the present invention. Exemplified compounds are also particularly preferred compounds of the present invention.

Add sodium cyanoborohydride (1.8 g, 29 mmol) to a solution of 2-fluoroacetophenone (2.0 g, 14.5 mmol) and ammonium acetate (11.2 g, 145 mmol) in methanol (45 mL). Concentrate the slurry *in vacuo*, dilute the residue with DCM and wash with 5N aqueous NaOH. Dry the organic layer, concentrate carefully, as the amine is volatile, under reduced pressure to one third of the volume, and load the material onto an SCX column (pre-wash column with methanol, followed by DCM, elute with 2M ammonia in methanol). Concentrate the fraction to one half of the volume to remove the ammonia, then add excess 2M hydrogen chloride in diethyl ether and concentrate to obtain the hydrochloride salt. Purify by chromatography on silica gel eluting with DCM/2M ammonia in methanol (20:1) to obtain the title compound (280 mg, 13%). MS (ES+) m/z : 140 (M+H)⁺.

The compounds of the present invention are relatively selective for the 5-HT_{2C} receptor. The compounds of the present invention are particularly relatively selective for the 5-HT_{2C} receptor in comparison to other 5-HT receptor subtypes and specifically the

5-HT_{2A} and 5-HT_{2B} receptors. This selectivity is demonstrated in the following agonist activity assays and receptor binding assays.

Agonist Activity Assays (G alpha q-GTPγ[³⁵S] Binding Assays)

5 The 5-HT₂ receptors are functionally coupled to specific G-proteins. Agonist activation of 5-HT₂ G-protein-coupled receptors results in the release of GDP from the α-subunit (G alpha q or G alpha i) of the G-protein and the subsequent binding of GTP. The binding of the stable analog GTPγ[³⁵S] is an indicator of receptor activation (i.e. agonist activity).

10

 The G alpha q-GTPγ[³⁵S] binding assay is used to determine the in vitro potency (EC₅₀) and maximal efficacy (E_{max}, normalized to the 5-HT response) of a test compound at the 5-HT_{2A}, 5-HT_{2B}, and 5-HT_{2C} receptors. The area under the dose response curve (AUC) is also determined for each receptor subtype and used to measure the test
15 compound's selectivity for the 5-HT_{2C} receptor over the 5-HT_{2A} and 5-HT_{2B} receptors, expressed as Selectivity Ratios (AUC 2C/2A and AUC 2C/2B, respectively). The Selectivity Ratios allow the assessment of selectivity based on both potency and efficacy. A selectivity measure that incorporates both potency and efficacy at the 5-HT_{2C} receptor, as compared to the 5-HT_{2A} and 5-HT_{2B} receptors, is considered important due to the
20 adverse events associated with 5-HT_{2A} and 5-HT_{2B} agonist activity (see introduction).

Membrane Preparation: Grow AV12 cells stably transfected with the human 5-HT_{2A}, 5-HT_{2B}, or 5-HT_{2C} receptors in suspension, harvest by centrifugation, wash the cell pellet with phosphate buffered saline, pH 7.4, pellet the cells again, remove the supernatant, freeze the cell pellet on dry ice and store at -70°C. Thaw stock cell pellet and resuspend
25 in 50mM Tris, pH 7.4, aliquot into 1-2 mL volumes and refreeze at -70°C for subsequent assays. (As is appreciated in the art, optimal cell quantities used per aliquot will vary with the individual transfected cell line used. In one embodiment, 5-HT_{2A} and 5-HT_{2C} transfected cells are typically used at about 6 x 10⁸ cells per aliquot, while 5-HT_{2B} cells are typically used at about 7.5 x 10⁸ cells per aliquot).

30

On the day of assay, thaw membranes, wash the membranes with assay buffer (50 mM Tris-HCl (pH 7.4), 10 mM MgCl₂, 100 mM NaCl, and 0.2 mM EDTA), resuspend in assay buffer and incubate for 10 min. at 37°C to hydrolyze any residual endogenous 5-HT. Wash the membranes again with assay buffer, and resuspend in assay buffer at a concentration to provide aliquots of about 1-4x10⁶ cell equivalents per well (typically about 1-2 x 10⁶ cell equivalents for assays with 5-HT_{2A} or 5-HT_{2C} receptor assays, and about 3-4 x 10⁶ cell equivalents for assays with 5-HT_{2B} receptor assays). Homogenize the cells with a tissue grinder and use the homogenate directly in the assay as described below.

G alpha q-GTPγ[³⁵S] Binding Assays: The immunoadsorption scintillation proximity assay (ISPA) of [³⁵S]-GTPγS binding to G alpha q is modified from published conditions (DeLapp et al, JPET **289** (1999) 946-955). Dissolve test compounds in DMSO and dilute in assay buffer to provide a range of concentrations to generate a concentration response curve. In wells of a 96 well microtiter plate, mix diluted test compound, GDP (0.1 μM final concentration), and [³⁵S]-GTPγS (between 0.5 and 1.0 nM final concentration). Add an aliquot of membranes to the incubation mixture and mix the plates to initiate agonist stimulation of the nucleotide exchange (200 μl final volume). Incubate the microtiter plates for 30 min. at room temperature. Quench the incubation with IGEPAL® CA-630 detergent (0.27% final concentration). Add affinity purified polyclonal rabbit anti-G alpha q antibody (about 1-2 μg per well), and anti-rabbit Ig scintillation proximity assay beads (Amersham; about 1.25 mg per well; 300 μl final volume). Seal the plates and incubate the mixture for 3 h at room temperature. Centrifuge the microtiter plates briefly to pellet beads. Quantitate the GTPγ[³⁵S] binding by microtiter plate scintillation spectrometry (Wallac Trilux MicroBeta™ scintillation counter).

Data Analysis: For each concentration response curve for a test compound at a given receptor, analyze the data with GraphPad Prism™ software (v3.02; GraphPad Software, San Diego, CA) running on a personal computer with MicroSoft Windows

OS®, using nonlinear regression analysis curve fitting to determine the EC_{50} and E_{max} (normalized to 5-HT control curves). Determine the Area Under the agonist concentration-response Curve (AUC) with GraphPad Prism™ by the trapezoidal method.

- 5 To calculate the Selectivity Ratios, first, determine the AUC for the test compound for each receptor subtype as described above. Second, normalize the AUC's at each receptor subtype relative to the AUC determined for 5-HT at that receptor. The normalized AUC for a test compound at a given receptor is therefore expressed as a percentage of the AUC determined for 5-HT at that receptor. For example:

10

$$5HT_{2A} \text{ Normalized AUC} = a = \frac{(\text{AUC}_{\text{test compound at } 5HT_{2A} \text{ receptor}})}{(\text{AUC}_{5-HT \text{ at } 5HT_{2A} \text{ receptor}})} \times 100\%$$

15

$$5HT_{2B} \text{ Normalized AUC} = b = \frac{(\text{AUC}_{\text{test compound at } 5HT_{2B} \text{ receptor}})}{(\text{AUC}_{5-HT \text{ at } 5HT_{2B} \text{ receptor}})} \times 100\%$$

$$5HT_{2C} \text{ Normalized AUC} = c = \frac{(\text{AUC}_{\text{test compound at } 5HT_{2C} \text{ receptor}})}{(\text{AUC}_{5-HT \text{ at } 5HT_{2C} \text{ receptor}})} \times 100\%$$

20

Third, calculate the Selectivity Ratios for the test compound as follows:

Selectivity Ratio for 5-HT_{2C} receptor/5-HT_{2A} receptor (AUC 2C/2A) = c/a

Selectivity Ratio for 5-HT_{2C} receptor/5-HT_{2B} receptor (AUC 2C/2B) = c/b

25

For reference purposes, the AUC 2C/2A and AUC 2C/2B for 5-HT are each 1.0. Likewise, the ratios for mCPP (*meta*-chlorophenylpiperazine) are tested and are found to be 2.1 and 2.1 respectively.

30

Representative compounds of the present invention are tested in the G alpha q-GTPγ[³⁵S] assays for the 5-HT_{2A}, 5-HT_{2B}, and 5-HT_{2C} receptors essentially as described above and are found to be a highly potent and selective agonists of the 5-HT_{2C} receptor, with EC_{50} 's typically less than or equal to 200 nM, and AUC 2C/2A and AUC 2C/2B ratios greater than 1.5. Preferred compounds are those with EC_{50} 's less than or equal to 100 nM, and AUC 2C/2A and AUC 2C/2B ratios greater than or equal to 2.0. More preferred are those with EC_{50} 's less than or equal to 50 nM, and AUC 2C/2A and AUC 2C/2B ratios greater than or equal to 3.0.

Ligand Binding Assays

The ligand binding affinity of the compounds of the present invention to the 5-HT_{2C} receptor subtype is measured essentially as described by Wainscott (Wainscott, *et al.*, *Journal of Pharmacology and Experimental Therapeutics*, 276:720-727 (1996)). Data is analyzed by nonlinear regression analysis on the concentration response curves using the four parameter logistic equation described by DeLean (DeLean, *et al.*, *Molecular Pharmacology*, 21, 5-16 (1982)). IC₅₀ values are converted to K_i values using the Cheng-Prusoff equation (Cheng, *et al.*, *Biochem. Pharmacol.*, 22, 3099-3108 (1973)).

Representative compounds of the present invention are tested essentially as described above and are found to have excellent affinity for the 5-HT_{2C} receptor, with K_i's typically less than or equal to about 200 nM. Preferred compounds are those with K_i's of less than or equal to about 100 nM. More preferred are those with K_i's less than or equal to 50 nM.

Affinities for other receptor subtypes can readily be determined by slight modification of the above described radioligand receptor binding assay using cells transfected with the desired receptor in place of cells transfected with the 5-HT_{2C} receptor subtype and using an appropriate radioligand. The binding affinities for representative compounds of the present invention for a variety of receptors are determined in such assays and the compounds are found to have surprisingly higher affinity for the 5-HT_{2C} receptor. Affinity for the 5-HT_{2C} receptor is found to be significantly higher than for other 5-HT receptor subtypes, and notably higher than the 5-HT_{2A} and 5-HT_{2B} receptor subtypes. Preferred compounds are those with IC₅₀'s equal to or greater than 300 nM for the alpha 1 and alpha 2 adrenergic receptors and equal to or greater than 500 nM for D₁ and D₂ dopaminergic receptors. More preferred compounds are those with IC₅₀'s equal to or greater than 1000 nM for the alpha 1 and alpha 2 adrenergic receptors and the D₁ and D₂ dopaminergic receptors. Still more preferred are those compounds with IC₅₀'s equal to or greater than 3000 nM for the alpha 1 and alpha 2 adrenergic receptors and the D₁ and D₂ dopaminergic receptors.

For the above in vitro assays, exemplified compounds are assayed and found to have either an EC_{50} or a K_i value of equal to or less than 50 nM, and to have AUC 2C/2A and AUC 2C/2B ratios of greater than or equal to 2.0. Exemplified compounds are
5 assayed and found to have alpha 1 and alpha 2 adrenergic receptor IC_{50} 's equal to or greater than 300 nM, and D_1 and D_2 dopaminergic receptor IC_{50} 's equal to or greater than 500 nM.

Rat feeding assays

10 The ability of the compounds of the present invention to treat obesity is demonstrated by testing in acute and chronic rat feeding assays.

Animals: Obtain male Long-Evans rats (Harlan Sprague-Dawley, Indianapolis, IN) that are approximately one hundred-days old and have been maintained on a calorie rich diet
15 since weaning (TD 95217, 40% calories from fat; Teklad, Madison, WI). House the rats individually with a 12 h:12 h light:dark cycle (lights on from about 22:00 h to about 10:00 h) and maintain rats on the same diet (TD 95217) with free access to water, for about 1-2 weeks to acclimate the rats to the environment. Dose rats orally with vehicle (10% acacia with 0.15% saccharin in water) once daily for at least 1 day (typically 1-2 days) to
20 acclimate the rats to the procedures. Randomize the rats into groups so each group has similar mean body weights.

Calorimetric Acute Feeding Assay: At approximately 8:00 h on the day of assay, weigh each rat and transfer to individual chambers of an open circuit calorimetry system
25 (Oxymax, Columbus Instruments International Corporation; Columbus, OH), with free access to food (pre-weighed) and water, and begin measuring VO_2 and VCO_2 . At approximately 10:00 h, dose rats orally with vehicle or test compound, return them to their calorimetry chambers, and continue measuring VO_2 and VCO_2 at regular time intervals (approximately hourly). At approximately 8:00 h the following day, measure rat
30 body weight and the remaining food, assuming the difference in weight of food is equal to the mass of food consumed. Calculate the 24 h energy expenditure (EE) and respiratory

quotient (RQ) essentially as described in Chen, Y. and Heiman, M. L., *Regulatory Peptide*, 92:113-119 (2000). EE during light photoperiod is indicative of the resting metabolic rate and RQ is indicative of the fuel source the animal utilizes (pure carbohydrate metabolism gives an RQ of about 1.0, pure fat metabolism gives an RQ of about 0.7, mixed carbohydrate and fat metabolism gives intermediate values for RQ). Calculate EE as the product of calorific value (CV) and VO_2 per body weight (kg); where $CV = 3.815 + 1.232 \cdot RQ$, and RQ is the ratio of CO_2 produced (VCO_2) to O_2 consumed (VO_2). Caloric intake is calculated as (mass of 24 h food intake in grams) x (physiological fuel value of the diet in kilocalorie/g) per kg of body weight.

Acute Feeding Assay with a selective 5-HT_{2C} receptor antagonist: The above calorimetric acute feeding assay is conducted with the following modifications. Open circuit calorimetry systems are not used and only the 24 h periodic food intake and body weight are measured. Three groups of rats are used with the first group receiving a subcutaneous dose of saline (0.5 mL) about 15 minutes prior to the oral dose of vehicle, the second group receiving a subcutaneous dose of saline (0.5 mL) about 15 minutes prior to the oral dose of test compound in vehicle, and the third group receiving a subcutaneous injection of a selective 5-HT_{2C} receptor antagonist, 6-chloro-5-methyl-N-{2-[(2-methylpyridin-3-yl-oxy)pyridin-5-yl]aminocarbonyl}-2,3-dihydroindole (3 mg/Kg, in 35% cyclodextrin, 0.5 mL), about 15 min. prior to the oral dose of test compound in vehicle.

Chronic Feeding Assay: At between approximately 8:00 h and 10:00 h on day one of the assay, weigh and orally dose each rat with vehicle or test compound and return the animal to its home cage, with free access to food (pre-weighed) and water. For each of days 2-15, at between approximately 8:00 h and 10:00 h, measure rat body weight and the weight of food consumed in the last 24 h period, and administer daily oral dose of test compound or vehicle. On days -2 and 15 measure total fat mass and lean mass by nuclear magnetic resonance (NMR) using an EchoMRI™ system (Echo Medical Systems, Houston Texas). (See Frank C. Tinsley, Gersh Z. Taicher, and Mark L. Heiman, "Evaluation of a New

Quantitative Magnetic Resonance (QMR) Method for Mouse Whole Body Composition Analysis", Obesity Research, submitted May 1, 2003.)

Representative compounds of the present invention are tested in acute and chronic feeding assays essentially as described above. In the acute assays, the compounds are found to significantly reduce 24 h food intake, which effect is blocked by pre-administration of the 5-HT_{2C} receptor antagonist. The compounds also are found to dose-dependently reduce RQ without significantly changing the energy expenditure during the light photo-period. Thus the compounds are found to reduce caloric intake and increase the proportion of fuel deriving from fat utilization, without significantly changing the resting metabolic rate. In the chronic assay, the compounds are found to significantly decrease cumulative food intake and cumulative body weight change in a dose-dependent manner compared to control animals. The decrease in body weight is found to be due to loss of adipose tissue while lean body mass is not changed.

The ability of the 5-HT_{2C} receptor agonists of the present invention to treat obsessive/compulsive disorder is demonstrated by testing in a variety of in vivo assays as follows:

Marble burying assay

Marble burying in mice has been used to model anxiety disorders including obsessive-compulsive disorders (OCD) due to ethological study of the behavior (e.g. Gyertyan I. "Analysis of the marble burying response: Marbles serve to measure digging rather than evoke burying", *Behavioural Pharmacology* 6: 24-31, (1995)) and due to the pharmacological effects of clinical standards (c.f., Njung'E K. Handley SL. "Evaluation of marble-burying behavior as a model of anxiety", *Pharmacology, Biochemistry & Behavior*. 38: 63-67, (1991)); Borsini F., Podhorna J., and Marazziti, D. "Do animal models of anxiety predict anxiolytic effects of antidepressants?", *Psychopharmacology* 163: 121-141, (2002)). Thus, drugs used in the treatment of generalized anxiety in humans (e.g. benzodiazepines) as well as compounds used to treat OCD (e.g. SSRIs like fluoxetine) decrease burying.

- House experimentally-naïve male, NIH Swiss mice (Harlan Sprague-Dawley, Indianapolis, IN) weighing between 28-35 g in groups of 12 for at least three days prior to testing in a vivarium with 12 h light and dark cycles. Conduct experiments during the
- 5 light cycle in a dimly lit experimental testing room. Dose mice with vehicle or test compound and, after a specified pretreatment interval (generally 30 min.), place each mouse individually on a rotorod (Ugo Basile 7650) operating at a speed of 6 revolutions/min. and observe for falling. After 2 min. on the rotorod, place the mice individually in a 17 x 28 x 12 cm high plastic tub with 5 mm sawdust shavings on the
- 10 floor that are covered with 20 blue marbles (1.5 cm diameter) placed in the center. After 30 min., count the number of marbles buried (2/3 covered with sawdust). Assess the test compound's effect on marble burying with Dunnett's test and the effect on rotorod performance by Fisher's exact test.
- 15 Clinically effective standard compounds suppress marble burying at doses that are devoid of motor-impairing effects as measured on the rotorod. The *in vivo* efficacy of 5HT_{2C} compounds at the 5HT_{2C} receptor is confirmed by the prevention of effects of the 5HT_{2C} agonists on marble burying by co-administration of the 5HT_{2C} receptor antagonist, 6-chloro-5-methyl-N-{2-[(2-methylpyridin-3-yl-oxy)pyridin-5-yl]aminocarbonyl}-2,3-
- 20 dihydroindole.

- Representative compounds of the present invention are assayed in the marble burying assay essentially as described and are surprisingly found to reduce burying behavior in the test mice. The reduction of burying behavior is found to be blocked by
- 25 co-administration of the 5-HT_{2C} antagonist. In contrast to the compounds of the present invention, the anxiolytic compound chlordiazepoxide and the antipsychotic compound chlorpromazine decrease marble burying only at doses that also disrupt rotorod performance.

Nestlet Shredding

Mice naturally will construct nests of material available in their living environment. Since this behavior is obsessive in nature, it has been used to model OCD (Xia Li, Denise Morrow and Jeffrey M. Witkin, "Decreases in nestlet shredding of mice by serotonin uptake inhibitors: comparison with marble burying", Psychopharmacology, submitted July 14, 2003). House experimentally-naïve male, NIH Swiss mice (Harlan Sprague-Dawley, Indianapolis, IN) weighing between 28-35 g in groups of 12 for at least three days prior to testing in a vivarium with a 12 h light/dark cycle. Conduct experiments during the light cycle in an experimental room with normal overhead fluorescent lighting. Dose mice with vehicle or test compound and after a specified pretreatment interval (generally 30 min.), place the mice individually in a 17 x 28 x 12 cm high plastic tub with about 5 mm sawdust shavings on the floor along with a pre-weighed multi-ply gauze pad (51 mm square). After 30 min., weigh the remainder of the gauze pad not removed by the mouse. Determine the weight of the gauze used for nestlet construction by subtraction. Compare the results for test compound treated mice to the results for vehicle control treated mice with Dunnett's test.

Clinically effective OCD treatment standard compounds suppress nestlet shredding at doses that are devoid of motor-impairing effects as measured by the rotorod test. The *in vivo* efficacy of 5HT_{2C} compounds at the 5HT_{2C} receptor is confirmed by the prevention of effects of the 5HT_{2C} agonists on nestlet shredding by co-administration of the 5HT_{2C} receptor antagonist, 6-chloro-5-methyl-N-{2-[(2-methylpyridin-3-yl)-oxy]pyridin-5-yl}aminocarbonyl}-2,3-dihydroindole.

Representative compounds of the present invention are assayed essentially as described above and are surprisingly found to suppress nestlet shredding at doses that are devoid of motor-impairing effects as measured by the rotorod test.

In contrast to the compounds of the present invention, the anxiolytic chlordiazepoxide and the psychomotor stimulant d-amphetamine decreases nestlet shredding only at doses that produce motoric side effects (depression or stimulation, respectively).

Schedule-Induced Polydipsia

Food-deprived rats exposed to intermittent presentations of food will drink amounts of water that are far in excess of their normal daily intake and in excess of their intake when given all of their food at one time (Falk JL. "Production of polydipsia in normal rats by an intermittent food schedule", *Science* 133: 195-196, (1961)). This excessive behavior is persistent and has been used to model OCD.

Maintain Wistar rats on a food restricted diet (to maintain 85% free feeding weight), but with free access to water. Train the rats in a behavioral testing chamber to press a lever to receive a food pellet under a fixed interval schedule, such that the rats are rewarded with a 45 mg food pellet the first time they press a lever after a 120 second interval has elapsed. The fixed interval is then reset to 120 seconds and the process repeated. Thus, during a 90 min. test session, the rats can earn a maximum of 45 pellets. The behavioral chamber is also equipped with a water bottle that is weighed before and after the session to determine the amount of water consumed.

Administer test compounds on Tuesdays and Fridays. Determine control day performances on Thursdays. Administer compounds either orally at 60 min. before the beginning of a test session, or subcutaneously at 20 min. before the beginning of a test session. Compare the rates of lever pressing and water consumption for each animal's performance during sessions after test compound treatment with that animal's performance during control sessions, expressed as a percent of the control rate. Average the individual percent of control rates for each dose and calculate the standard error of the mean.

Clinically effective OCD treatment standard compounds (e.g. clomipramine, fluoxetine) suppress schedule-induced polydipsia without producing notable changes in motor patterns, food intake, or behavior the following day. The *in vivo* efficacy of 5HT_{2C} compounds at the 5HT_{2C} receptor is confirmed by the prevention of effects of the 5HT_{2C} agonists on excessive drinking by co-administration of the 5HT_{2C} receptor antagonist, 6-

chloro-5-methyl-N-{2-[(2-methylpyridin-3-yl-oxy)pyridin-5-yl]aminocarbonyl}-2,3-dihydroindole.

Representative compounds of the present invention are assayed in the schedule-induced polydipsia assay essentially as described above and are surprisingly found to suppress schedule-induced polydipsia without producing notable changes in motor patterns, food intake, or behavior the following day. The behavior suppression is blocked by co-administration of the 5-HT_{2C} antagonist.

In contrast to the compounds of the present invention, the psychomotor stimulant d-amphetamine decreases excessive drinking only at behaviorally stimulating doses and these effects are not prevented by the 5HT_{2C} receptor antagonist.

While it is possible to administer compounds employed in the methods of this invention directly without any formulation, the compounds are usually administered in the form of pharmaceutical compositions comprising a pharmaceutically acceptable excipient and at least one compound of Formula I or a pharmaceutically acceptable salt thereof. These compositions can be administered by a variety of routes including oral, rectal, transdermal, subcutaneous, intravenous, intramuscular, and intranasal. The compounds employed in the methods of this invention are effective as both injectable and oral compositions. Such compositions are prepared in a manner well known in the pharmaceutical art. *See, e.g.* REMINGTON'S PHARMACEUTICAL SCIENCES, (16th ed. 1980).

In making the compositions employed in the present invention the active ingredient is usually mixed with at least one excipient, diluted by at least one excipient, or enclosed within such a carrier which can be in the form of a capsule, sachet, paper or other container. When the excipient serves as a diluent, it can be a solid, semi-solid, or liquid material, which acts as a vehicle, carrier or medium for the active ingredient. Thus, the compositions can be in the form of tablets, pills, powders, lozenges, sachets, cachets, elixirs, suspensions, emulsions, solutions, syrups, aerosols (as a solid or in a liquid medium), ointments containing for example up to 10% by weight of the active compound,

soft and hard gelatin capsules, suppositories, sterile injectable solutions, and sterile packaged powders.

In preparing a formulation, it may be necessary to mill the compound to provide the appropriate particle size prior to combining with the other ingredients. If the active compound is substantially insoluble, it ordinarily is milled to a particle size of less than 200 mesh. If the active compound is substantially water soluble, the particle size is normally adjusted by milling to provide a substantially uniform distribution in the formulation, e.g. about 40 mesh.

Some examples of suitable excipients include lactose, dextrose, sucrose, sorbitol, mannitol, starches, gum acacia, calcium phosphate, alginates, tragacanth, gelatin, calcium silicate, microcrystalline cellulose, polyvinylpyrrolidone, cellulose, water, syrup, and methyl cellulose. The formulations can additionally include: lubricating agents such as talc, magnesium stearate, and mineral oil; wetting agents; emulsifying and suspending agents; preserving agents such as methyl- and propylhydroxybenzoates; sweetening agents; and flavoring agents. The compositions of the invention can be formulated so as to provide quick, sustained or delayed release of the active ingredient after administration to the patient by employing procedures known in the art.

The compositions are preferably formulated in a unit dosage form, each dosage containing from about 0.05 to about 100 mg, more usually about 1.0 to about 30 mg, of the active ingredient. The term "unit dosage form" refers to physically discrete units suitable as unitary dosages for human subjects and other mammals, each unit containing a predetermined quantity of active material calculated to produce the desired therapeutic effect, in association with a suitable pharmaceutical excipient.

The compounds are generally effective over a wide dosage range. For examples, dosages per day normally fall within the range of about 0.01 to about 30 mg/kg. In the treatment of adult humans, the range of about 0.1 to about 15 mg/kg/day, in single or divided dose, is especially preferred. However, it will be understood that the amount of

the compound actually administered will be determined by a physician, in the light of the relevant circumstances, including the condition to be treated, the chosen route of administration, the actual compound or compounds administered, the age, weight, and response of the individual patient, and the severity of the patient's symptoms, and therefore the above dosage ranges are not intended to limit the scope of the invention in any way. In some instances dosage levels below the lower limit of the aforesaid range may be more than adequate, while in other cases still larger doses may be employed.

Another preferred formulation employed in the methods of the present invention employs transdermal delivery devices ("patches"). Such transdermal patches may be used to provide continuous or discontinuous infusion of the compounds of the present invention in controlled amounts. The construction and use of transdermal patches for the delivery of pharmaceutical agents is well known in the art. See, e.g., U.S. Patent 5,023,252, issued June 11, 1991, herein incorporated by reference. Such patches may be constructed for continuous, pulsatile, or on demand delivery of pharmaceutical agents.

Under some circumstances, it will be desirable or necessary to introduce the pharmaceutical composition to the brain, either directly or indirectly. Direct techniques usually involve placement of a drug delivery catheter into the host's ventricular system to bypass the blood-brain barrier. One such implantable delivery system, used for the transport of biological factors to specific anatomical regions of the body, is described in U.S. Patent 5,011,472, issued April 30, 1991, which is herein incorporated by reference.

Indirect techniques, which are generally preferred, usually involve formulating the compositions to provide for drug latentiation by the conversion of hydrophilic drugs into lipid-soluble drugs or prodrugs. Latentiation is generally achieved through blocking of the hydroxy, carbonyl, sulfate, and primary amine groups present on the drug to render the drug more lipid soluble and amenable to transportation across the blood-brain barrier. Alternatively, the delivery of hydrophilic drugs may be enhanced

by intra-arterial infusion of hypertonic solutions which can transiently open the blood-brain barrier.

5 The type of formulation employed for the administration of the compounds employed in the methods of the present invention may be dictated by the particular compound employed, the type of pharmacokinetic profile desired from the route of administration, and the state of the patient.
